Hand, foot and mouth disease
Hand, foot and mouth disease is usually a mild viral illness which is common in children. Diagnosis is made by a local doctor, and there is no specific treatment. Good personal hygiene is important to prevent spread of the disease.

Hand, foot and mouth disease (HFMD) is caused by a virus (usually from the coxsackie group of enteroviruses, particularly coxsackie virus A16). It causes blisters on the hands and feet, in the mouth and often in the ‘nappy’ area. It is generally only a mild disease that lasts seven to ten days.

HFMD is more common during warmer weather and tends to spread easily between children. There is no connection between this disease and the foot and mouth disease that affects cattle and some other animals.

HFMD occurs mainly in children under ten years of age, but can also affect older children and adults. Outbreaks may occur in childcare settings. By the time they are adults, most people have been infected with the virus that causes this disease.

Spread of hand, foot and mouth disease

This infection is spread by direct contact with fluid from the skin blisters, nose and throat discharges (including saliva, sputum or nasal mucus), droplets (sneezing, coughing) and faeces (stools). Good personal hygiene is important to prevent spread of the infection to others.

The skin blisters of HFMD are infectious until they become crusty and there is no fluid in the blisters. The virus may also be shed in the faeces (poo) for several weeks after the blisters resolve.

Symptoms of HFMD

People usually develop symptoms between three to seven days after being infected. The most common symptoms include:

- High temperature (fever)
- Sore throat
- Small, blister-like lesions that may occur on the inside of the mouth, sides of the tongue, palms of the hands, fingers, soles of the feet and ‘nappy’ area.
- Children are often irritable, tired, and may be off their food.

Very rarely, the virus can affect the lining of the brain or spinal cord, leading to more severe symptoms such as seizures, confusion, unsteadiness, and weakness.

Diagnosis of HFMD

Diagnosis is usually made by your local doctor based on symptoms. Other tests are not usually required, but occasionally throat or faeces samples may be taken.

Treatment for HFMD

HFMD is a mild illness that resolves within a few days. There is no specific treatment and usually none is required.

Use paracetamol (not aspirin) as directed for fever and any discomfort. Offer plenty of fluids, but avoid orange juice, which is acidic and may cause pain with mouth ulcers. Allow blisters to dry naturally. Do not pierce blisters, as the fluid within them is infectious.
If a child with HFMD complains of severe headache, if fever persists, or if there are any worrying symptoms, consult your local doctor immediately.

**Prevention of HFMD**

Good personal hygiene is essential to prevent the spread of HFMD to others, both for those infected and their carers. This includes:

- Washing hands carefully with soap and water after contact with the blister-like lesions, after handling nose and throat discharges, and after contact with faeces such as with toileting and nappy changing.
- Using separate eating and drinking utensils.
- Avoid sharing items of personal hygiene (e.g. towels, washers and toothbrushes) and clothing (particularly shoes and socks).
- Thoroughly wash and clean any soiled clothing and surfaces or toys that may have been contaminated.
- Teach children about cough and sneeze etiquette, immediate disposal of tissues, and to wash hands afterwards.

Children with HFMD should be excluded from school and childcare centres until all of the blisters have dried. To assist in prevention of spread, parents should report the illness to the director of the childcare centre or school principal.

**Where to get help**

- Your doctor
- NURSE-ON-CALL Tel. 1300 606 024 – for expert health information and advice (24 hours, 7 days)
- Child health care workers
- Maternal and Child Health Line (24 hours) Tel. 132 229
- Department of Health Victoria, Victorian Government – Environmental Health Unit Tel. 1300 761 874

**Things to remember**

- Hand, foot and mouth disease is usually a mild viral illness which is common in children.
- Diagnosis is made by a local doctor, and there is no specific treatment.
- Good personal hygiene is important to prevent spread of the disease.

Beat the Bite is a Victorian government health campaign to highlight awareness of the risk of mosquito-borne diseases in Victoria. Find resources to be printed and shared along with videos that tell...
Beat the Bite! Mosquito-borne disease risk and management (video)

Dr Finn Romanes, public health doctor at Victoria, Department of Health and Human Services explains the department’s program to monitor and manage the risks associated with Mosquitoes. Learn about the...

Bird flu (avian influenza)
The symptoms of bird flu in humans are similar to those of regular influenza.

Dengue virus disease
Dengue virus disease (dengue fever, or ‘dengue’) is a viral disease transmitted by mosquitoes in many tropical and subtropical parts of the world.

Hendra virus
The best defence against Hendra virus is to avoid contact with an infected horse.

Leptospirosis
Leptospirosis is a disease spread from animals to humans, caused by infection with the bacteria Leptospira.

Malaria
Travellers who visit malarial locations should avoid mosquito bites and take anti-malarial drugs.

Mosquitoes can carry diseases
You can reduce the risk of mosquito bites if you get rid of potential mosquito breeding sites around your home.

Murray Valley encephalitis
The only protection from Murray Valley encephalitis (MVE) is to avoid mosquito bites.

Pets – safe handling of reptiles and tropical fish
People in contact with tropical fish and reptiles such as turtles, lizards and snakes may be at risk of infections and illness due to germs (such as bacteria, viruses and parasites) carried on the...

Pinworms
Despite the unsavoury reputation, a pinworm infection (worms) is relatively harmless and easily treated.

Psittacosis - parrot fever
People who have birds as pets, poultry workers and anyone working in aviaries or pet shops, are most at risk of catching psittacosis.

Q fever
Q fever is caused by a micro-organism that can be carried by cattle, sheep and goats.

Ross River virus disease
Most people recover from Ross River virus disease, although some people have symptoms for a year or more.

Tapeworms and hydatid disease
It's important for your own health to control tapeworm infection in your dog.

Toxoplasmosis
Problems only occur if a woman becomes infected with parasites that cause toxoplasmosis for the first time while pregnant.

West Nile virus
All disease-carrying mosquitoes breed in water or require water to enable eggs to hatch.

Zika virus
Zika virus is a mosquito-borne virus. There is no cure, specific treatment or vaccine for Zika virus.

A-Z of infectious disorders

Anthrax
Anthrax is a rare but potentially fatal bacterial disease that occasionally infects humans.

Aspergillosis
Aspergillosis is a fungus that commonly grows on rotting vegetation. It can cause asthma symptoms.

Australian bat lyssavirus (ABLV)
The simplest form of prevention for lyssavirus is to avoid close contact with bats.

- **Bacterial vaginosis**
  Bacterial vaginosis (BV) is caused by an imbalance of the bacteria normally present in the vagina.

- **Barmah Forest virus disease**
  Barmah Forest virus (BFV) disease can cause joint inflammation and pain, fatigue and a rash of variable appearance. A full recovery can be expected. Most people recover completely within six months.

- **Beat the Bite**
  Beat the Bite is a Victorian government health campaign to highlight awareness of the risk of mosquito-borne diseases in Victoria. Find resources to be printed and shared alone with videos that tell...

- **Beat the Bite! Mosquito-borne disease risk and management (video)**
  Dr Finn Romanes, public health doctor at Victoria, Department of Health and Human Services explains the department’s program to monitor and manage the risks associated with Mosquitoes. Learn about the...

- **Beat the Bite mosquitoes - learn how to beat the bite (video)**
  Hear from Victoria's Chief Health Officer talk about how you can protect yourself from mosquitoes this season.

- **Bird flu (avian influenza)**
  The symptoms of bird flu in humans are similar to those of regular influenza.

- **Bites and stings – first aid**
  If you are bitten or stung by an insect or animal, apply first aid and seek medical treatment as soon as possible.

- **Boils**
  Some areas of the body are more susceptible to boils, including the face, throat, armpits, groin and buttocks.

- **Botulism**
  Botulism is considered a medical emergency. If untreated, it may cause death.

- **Bursal ulcer**
  Since the ulcer gets bigger with time, early diagnosis and prompt treatment of Bairnsdale disease can keep skin loss to a minimum.

- **Candida auris (C. auris)**
  Candida is a genus of fungi (yeasts) that live on the skin and inside the human body. Candida auris (also called C. auris) is an uncommon fungus that can cause serious infections.

- **Cellulitis**
  Cellulitis is a bacterial infection of the skin that occurs most commonly on the lower legs and in areas where the skin is damaged or inflamed.

- **Chest infections**
  A chest infection affects your lungs, either in the larger airways (bronchitis) or in the smaller air sacs (pneumonia).

- **Chickenpox**
  Chickenpox is highly contagious, but it is generally mild and gets better without the need for special treatment.

- **Chlamydia**
  Chlamydia is often called the ‘silent infection’ because most people do not realise they have it.

- **Colds**
  Cold viruses are spread by sneezing, coughing and hand contact.

- **Cold sores**
  Cold sores are blisters around the mouth and nose, caused by the herpes simplex virus.

- **Coughing and wheezing in children**
  Coughing and wheezing in babies can be distressing for you and your baby, but in most cases symptoms can be relieved at home.

- **Croup**
  Croup is a viral infection of the throat and windpipe that causes noisy breathing, a harsh voice and a harsh, barking cough.

- **Cystitis**
  Cystitis

betterhealth.vic.gov.au
Cystitis is the most common urinary tract infection in women.

- Cytomegalovirus (CMV)
  If an unborn baby gets CMV from their mother, it can cause hearing loss and intellectual disability.

- Dengue virus disease
  Dengue virus disease (dengue fever, or ‘dengue’) is a viral disease transmitted by mosquitoes in many tropical and subtropical parts of the world.

- Diarrhoea
  Acute diarrhoea in babies and young children can be life threatening.

- Diptheria
  Diptheria is a serious bacterial disease that causes severe inflammation of the nose, throat and windpipe.

- Ebola virus disease (EVD)
  Ebola virus is a rare disease that can cause severe symptoms and can be life-threatening.

- Epididymitis
  Epididymitis is an infection that causes inflammation of the epididymis.

- Eyes - trachoma
  A clean face and clean environment are the best protection against trachoma.

- Fatigue fighting tips
  Activity and nutrition help fight fatigue and put more energy into your daily life.

- Fever - children
  Fever is a way in which the body fights infections. A fever is not dangerous and does not always indicate a serious illness.

- Fever - febrile convulsions
  A febrile convolution is a fit that occurs in children when they have a high fever.

- Flu (influenza)
  Influenza (the flu) is caused by a virus. The flu is more than just a bad cold and can occasionally lead to serious complications, including death. Specific antiviral medication is available. It is...

- Food poisoning - listeria
  Listeria infection is uncommon but very dangerous for the elderly, people whose immune systems are not working properly and pregnant women and their unborn babies.

- Gastroenteritis
  It is important to establish the cause of gastro, as different types of gastroenteritis respond to different treatments.

  Gastroenteritis - amoebiasis
  Amoebiasis can cause diarrhoea among travellers to developing countries.

  Gastroenteritis - campylobacteriosis
  Campylobacteriosis is a type of gastroenteritis and is more common in children under five years of age and young adults.

  Gastroenteritis - cryptosporidiosis
  Outbreaks of cryptosporidiosis have been associated with child care centres, public swimming pools and contaminated water supplies.

  Gastroenteritis - giardiasis
  Most people infected with Giardia parasites do not develop symptoms but can still spread the infection to others.

  Gastroenteritis in children
  Gastroenteritis or Gastro can be dangerous for very young babies. Gastro is common in young children and spreads easily. Gastro is a bowel infection which causes diarrhoea (runny or watery poo) and...

  Gastroenteritis - salmonellosis
  You may be more prone to salmonellosis if you are elderly, have another medical condition (such as a weakened immune system) or are malnourished.

  Gastroenteritis - shigellosis

betterhealth.vic.gov.au
Outbreaks of shigella gastroenteritis can occur in institutional settings, particularly where children are still in nappies or adults are incontinent.

- **Genital herpes**
  Many people with genital herpes are not aware that they have the infection, because they have no symptoms.

- **Genital warts**
  Genital warts are one of the most common sexually transmissible infections.

- **Glandular fever**
  Glandular fever is most common among high school and university students, but young children can also become infected by saliva on toys, shared cups, or the hands of carers.

- **Gonorrhoea**
  Gonorrhoea, also spelt gonorrhea, affects both men and women and is transmitted during sex, it may lead to infertility in women if left untreated.

- **Haemolytic uraemic syndrome**
  Haemolytic uraemic syndrome (HUS) is a rare condition which can lead to chronic kidney damage or death from kidney failure.

- **Hand, foot and mouth disease**
  Good personal hygiene is essential to prevent the spread of hand, foot and mouth disease to others, both for those infected and their carers.

- **Heart conditions - endocarditis**
  Endocarditis is an infection of the heart valves or the inner lining of the heart.

- **Hendra virus**
  The best defence against Hendra virus is to avoid contact with an infected horse.

- **Hepatitis**
  Hepatitis is an umbrella term for several diseases that affect the liver.

  - **Hepatitis A**
    Immunisation is the best protection against hepatitis A infection and it is recommended for people in high-risk groups.

  - **Hepatitis B**
    Hepatitis B is a viral infection that affects the liver and can lead to serious illness or death.

  - **Hepatitis C**
    In Australia, hepatitis C is most often spread through the sharing of unsterile drug injecting equipment. New all oral combination treatment has greatly improved health outcomes for people with hepatitis C.

  - **Hepatitis C Cure - what it means for Victorians (video)**

  - **HIV**
    In Australia, HIV is most commonly spread when having sex without a condom and when sharing needles and other injecting equipment.

  - **Impetigo - school sores**
    Impetigo, or school sores, is a highly contagious skin infection that commonly affects school-aged children.

  - **Labyrinthitis and vestibular neuritis**
    Labyrinthitis and vestibular neuritis are disorders that result in inflammation of the inner ear and the nerve connecting the inner ear to the brain.

  - **Legionnaires’ disease**
    Legionnaires’ disease is a rare form of pneumonia.

  - **Leprosy (Hansen’s disease)**
    Once a person with leprosy begins treatment they quickly become non-infectious.

  - **Leptospirosis**
    Leptospirosis is a disease spread from animals to humans, caused by infection with the bacteria Leptospira.

  - **Malaria**
Travellers who visit malarial locations should avoid mosquito bites and take anti-malarial drugs.

- **Measles**
  Measles can cause serious and sometimes fatal complications, including pneumonia and brain inflammation.

- **Measles, mumps, rubella, varicella (chickenpox) – immunisation**
  Immunisation is the best protection against measles, mumps, rubella and varicella (chickenpox).

- **Meningitis**
  Meningitis can cause death and requires urgent medical attention.

- **Meningococcal disease**
  Do not leave young adults alone if they suddenly develop a fever because they may become seriously ill very quickly.

- **Molluscum contagiosum**
  Molluscum contagiosum can be mistaken for genital warts or pimples, check with your doctor for an accurate diagnosis.

- **Mosquitoes can carry diseases**
  You can reduce the risk of mosquito bites if you get rid of potential mosquito breeding sites around your home.

- **Mumps**
  Mumps is a viral illness that causes fever and swollen salivary glands, and a swollen face.

- **Murray Valley encephalitis**
  The only protection from Murray Valley encephalitis (MVE) is to avoid mosquito bites.

- **New drugs for the treatment of hepatitis C – Frequently Asked Questions for patients**
  In Australia, hepatitis C is most often spread through the sharing of unsterile drug injecting equipment. New all oral combination treatment has greatly improved health outcomes for people with.

- **Osteomyelitis**
  Osteomyelitis means an infection of bone which can either be recent or longstanding.

- **Parechovirus**
  Good personal hygiene is essential to prevent the spread of parechovirus to others, both for those infected and their carers.

- **Pericarditis**
  Pericarditis symptoms may be similar to those of heart attack and include chest pain and abnormal heart rhythms.

- **Pets – safe handling of reptiles and tropical fish**
  People in contact with tropical fish and reptiles such as turtles, lizards and snakes may be at risk of infections and illness due to germs (such as bacteria, viruses and parasites) carried on the.

- **Pinworms**
  Despite the unsavoury reputation, a pinworm infection (worms) is relatively harmless and easily treated.

- **Pleurisy**
  Treating any infection of the upper respiratory tract quickly will reduce the risk of developing pleurisy.

- **Pneumococcal disease**
  Pneumococcal disease is a leading cause of serious illness and death in young children.

- **Pneumonia**
  Anyone can get pneumonia, but young children and the elderly are most susceptible.

- **Polio and post-polio syndrome**
  Polio is a serious disease that can cause life-threatening paralysis and possibly death.

- **Psittacosis - parrot fever**
  People who have birds as pets, poultry workers and anyone working in aviaries or pet shops, are most at risk of catching psittacosis.

- **Q fever**
  Q fever is caused by a micro-organism that can be carried by cattle, sheep and goats.

---

betterhealth.vic.gov.au
- **Reactive arthritis**
  Reactive arthritis is a form of arthritis that occurs as a result of some bacterial infections.

- **Rheumatic fever**
  Untreated rheumatic fever can lead to serious complications such as rheumatic heart disease.

- **Roseola infantum**
  Roseola is a mild viral infection with associated fever and rash that affects babies and young children.

- **Ross River virus disease**
  Most people recover from Ross River virus disease, although some people have symptoms for a year or more.

- **Rotavirus**
  Rotavirus is a common cause of viral gastroenteritis for Australian babies and preschool children.

- **Rubella**
  Rubella is a mild illness for most people, but very dangerous for pregnant women and their babies.

- **Salpingitis**
  Salpingitis is one of the most common causes of female infertility and may permanently damage the fallopian tubes.

- **Septicemia**
  Bacteria in the bowels, urinary tract, mouth and skin can cause disease if they get into the bloodstream.

- **Shiga toxin-producing E.coli**
  There are many types of E.coli bacteria, most of which are harmless. However, some types of E.coli produce toxins (poisons) that can cause gastroenteritis (gastro). One of these types of E.coli is...

- **Shingles**
  Shingles is caused by the same virus responsible for chickenpox.

- **Smallpox**
  Smallpox was once a feared and highly contagious viral disease.

- **Staphylococcus aureus - golden staph**
  Hospital patients are more likely to be infected by golden staph because of surgical or other wounds.

- **Streptococcal infection - group A**
  Streptococcal infection - group A can cause sore throats (pharyngitis), scarlet fever or impetigo (school sores).

- **Streptococcal infection – group B**
  Group B streptococcal bacteria can cause a wide range of illnesses in susceptible people including newborns, the elderly and those with pre-existing medical conditions such as diabetes or cancer. Out...

- **Styes**
  Styes may be red and sore, but they generally do not cause any damage to the eye or eyelids.

- **Swimmer's ear**
  Swimmer's ear can be triggered by exposure to water or mechanical damage due to overzealous cleaning.

- **Tapeworms and hydatid disease**
  It's important for your own health to control tapeworm infection in your dog.

- **Tetanus**
  Tetanus is a life-threatening disease and immunisation is the best way to reduce your risk.

- **Time to immunise - free vaccines for men who have sex with men**
  Immunisation is one of the best ways you can protect yourself and others from infectious diseases in our community. In partnership with Thorne Harbour Health (formerly Victorian AIDS Council), the...
